

CSE471: System Analysis and Design
Assignment on Functional Requirements
Proposed Project Title: Project Management Application [Sample]

Group No: 5, CSE471 Lab Section: 04, Fall 2025	
ID	Name
22301755	Ehteshamul Haque Adit
22301296	Shafe Al Toha
22241020	Abrar Masud

Submission Date:

Tech Stack:

- Language: Dart, Javascript
- Framework: Express.js, React, Flutter
- Styling: Dart based widget styling, Tailwind CSS
- Database: PostgreSQL
- ORM: Prisma
- Deployment: Oracle Cloud

Functional requirements:

Module 1

1. [Member-1] Admin, Renters, Investor, Producer. All of them can securely sign in or sign up to their platforms. The security will be provided by JWT token. Users can also reset their password using email verification using an otp.
2. [Member-2] Renters, Investor can securely pay using sslcommerz. Producers can make a withdrawal request to the Admins. Admins can review and process a withdrawal request to confirm and notify the Producers.
3. [Member-3] Producers can list the products they are offering and post it with different images and videos and info about the product with a production time (instant/ n numbers of days). Each listing will have a comment section where the producer can replay. A review section where investors who have invested can leave a review any time. All listings will have an upvote and downvote system.

Module 2

1. [Member-1] Investors can invest in products. If a product got 100% investment then the producer will confirm the order and deliver the product on time. In the meantime the investor can list the product in the rentable product pool where any renter will be able to rent the product. To make any decision (Increase or decrease rent price) with the product, investors need to come up with a decision by voting. The voting system will be a weighted voting scheme where weight is their share in that product. Investors can keep the product to their place or in our warehouse. To keep in our warehouse they have to pay a security fee every month according to the product's size, weight and price. Investors can see the live location of the product. For the live location feature investors need to pay additional safety fee.

2. [Member-2] Admin can view or edit or manage every producer's post. Admin can notify them if they did anything wrong. Admin can also temporarily block any producer, investor, renter's account from using the platform and if they did then the user will get an email. Every blocked account will be frozen until the user proves their innocence.
3. [Member-3] There will be a tag along with every user, if they are verified by only email or with a KYC face verification. (Renter, Investor, Producer) Users can do the KYC verification anytime from the app.

Module 3

1. [Member-1] A dashboard shows an overview of tasks, project status, and progress metrics, including a project matrix that visualizes various information about the project.
2. [Member-1] Users can create tasks with details like title, description, due date, and priority level.
3. [Member-2] Tasks can be organized within projects to keep related tasks grouped together.
4. [Member-2] Users receive notifications for upcoming deadlines and completed tasks to stay updated.
5. [Member-3] Search and filter options allow users to locate projects by keywords.
6. [Member-3] Users can view their activity history for a summary of recent actions.
